SERVICE MANUAL

KENWOOD

© 1996-3/B51-5166-00 (K/K) 3794

Illustration is KR-V990D.

* Refer to parts list on page 89.

PRECAUTIONS FOR REPAIR

- Can not use jig KSJ-0816 for the transmission frequency $455 \pm 2.2\text{kHz}$ of remote controller.
- For the serial test mode of the **CIRCUIT DESCRIPTION**, see Service Manual (B51-5162-00) of KR-V7080/V8080.

KR-V990D/V9080

REMOTE CONTROL OPERATION

The remote control unit provided with unit functions in the following two modes so that it can be used to control other KENWOOD system components as well as video components from other manufacturers.

KENWOOD component control mode This mode is used to control the KENWOOD source components including cassette decks and a CD player. (The controlled components must be connected to this unit through system control cords.)

Video component control mode This mode allows to control the basic operations of video components from KENWOOD as well as other manufacturers.

Some of the keys act in different ways depending on the modes described above. Therefore, be sure to adjust the required mode before pressing these keys.

MACRO 1, MACRO 2 keys

Use to operate several components automatically (MACRO PLAY).

In Graphical User Interface (GUI) mode, use to move the pointer.
In other modes, use to operate the various components.

INPUT key

Use to select an input source.

DISPLAY MODE key

Use to switch the display mode.

TAPE 2(MONITOR) key

Use to monitor a recording.

MUTE key

Use to temporarily mute the sound.

MODEL: RC-R0903
Infrared Ray System
Transmission frequency : 455 ± 25kHz

GUI key

Use to activate the Graphical User Interface mode.

Component control selection keys

Activate the Kenwood operation mode, and select the component to be remote controlled.

Component control selection keys

Activate the Video operation mode, and select the component to be remote controlled.

Numeric keys / +10 key

VOLUME key

Use to adjust the volume.

ENTER key

Use when entering TV channels.

Loading batteries

① Remove the cover.

② Insert batteries.

③ Close the cover.

* Insert two AA-size (R6 / SUM-3) batteries as indicated by the polarity markings.

KR-V990D/V9080

DISASSEMBLY FOR REPAIR

1. How to remove the Power transistor

Illust. 1

1. Remove the one screw ①, two screws ② and the one screw ③ on the Mounting hardware.
2. Cut the two Wire bands ④ with the Cutting nipper, etc.

CK DIAGRAM

CIRCUIT DESCRIPTION

1. Function

1-1. XS8/SL16 system changeover

Implements an additional operation by the system in order to shift a system operated by XS8 to SL16.

1-1-1. SL16

Easy operation one way amplifier and receiver. Other source devices are compatible with one-way and two-way easy operation. Operation is 16-bit. Operation is two way and compatible with operating mode display. Also, adding MD to input selector makes it compatible with easy operation. Apart from TUNER, source devices are operating mode display compatible and input selector MD compatible. Since it is not possible for the amplifier and receiver to be always compatible with operating mode displays, they are only input selector MD compatible and SL16 compatible.

1-1-2. Addition of a selector source

Adding a system operation adds selector sources MD and controls MD system operation.

(1) Selector source switching

MD are switched as TAPE1 background modes separately from the normal selector functions.

- Switch the selector source by holding down the AUTO panel key for at least two seconds.

TAPE1'MD

(If another key is entered while the key is being entered, the key input is set to off and the key is made ineffective.)

When a MD is used, the MD is connected to the RCA Pin of TAPE1.

- The operation of the system controls only the currently selected source and as no control whatsoever over the operation of the side which is not selected. For example, while MD is selected, even if the "Deck B Play" serial code is received, MD will remain selected without switching from MD to TAPE1.

(2) Settings during microprocessor backup or initialization

- During microprocessor initialization the selector is set to TAPE1. The current selector mode (TAPE1/MD) is maintained except when the backup is disrupted.

(3) Other items be noted

- This selector switching function has been developed in accordance with new serial codes. Therefore, if XS8 is used, since there is no code for MD, the selector source function will not work if the 8/16-bit serial mode is 8-bit. It works only in 16-bit mode. Also, if serial mode has been switched from 16-bit to 8-bit when MD are being selected, it will force a switch to TAPE1.

1-2. GUI (Graphic User Interface) function

This function enables the user to control each unit from the screen by combining the OSD-IC (On-Screen Display-IC) with a split (arrow on the screen) and the remote controller with a direction key that moves a split.

1-3. OSD (On Screen Display) display by new 16-bit serial communication

In a new 16-bit system, the current state of other models (CD deck, etc.) that communicate data in series can be displayed on the OSD screen.

1-4. Repeater function

This function enables the units (television, video, etc.) of other companies to be controlled using remote control code libraries and external remote control output units in the world that the UEI company (U.S.A.) has.

1-5. Macro play

This function enables the user to continuously output the preset remote control code. (Two channels)

1-6. Outline of AC-3 (KR-V990D)

1-6-1. Introduction

The sound in major motion pictures such as "Forest Gump" is recorded on film with AC-3, a highly efficient coding system developed by the Dolby Corporation called Dolby SR-D. To be precise, the sound on these movies is recorded on both a 4-channel Dolby optical track and a 5.1-channel Dolby SR-D digital track. Up to now, when a motion picture is recorded on video cassette, laser disc player, etc., the optically recorded 4-channel track has been matrix encoded to two channels and recorded on the video cassette or laser disc. On playback the channels were passed through a decoder called Pro Logic which restored the original four channels for surround playback.

CIRCUIT DESCRIPTION

Figure 1 : Channel configuration

With AC-3, the 5.1-channel SR-D track is recorded to laser disc without change (actually the bit rate is slightly altered) and the AC-3 decoder restores the original 5.1-channels. The important factor here is that with AC-3, the original channel conditions are not changed by any transmission circuit. In other words, even with a directional booster circuit, the best inter-channel separation obtainable with Pro Logic was about 30 dB but with AC-3, the original separation can be reproduced without change. AC-3 is not only for motion pictures. It is scheduled to be available for use with the currently topical DVD (SD standard) and it is said that it can also be used with a variety of other media.

1-6-2. Comparison with Other Types

Table shows a comparison with the currently topical MD and DCC bit compression systems.

System	PASC	ATRAC	AC-3
Number of channels	2	2	≤3+2+0.1
Bit rate	384kbps	256kbps	384kbps
Processing Type	Sub-band	Transform	Transform
Application	DCC	MD	CATC/HDTV

Table 1 : High efficient digital audio coders for general use

AC-3 uses adaptive transform coding which is closer to MD's ATRAC than it is to the PASC used by digital compact cassettes. Even here, their greatest feature is that they are multi-channel based. That is to say, if we use appropriate words, it means that the bit allocation conforms to the number of channels. It means that if the source has two channels, compression in respect of those two channels is applied not independently but as if they were one channel. In other words, if at an time there is more information on one channel than on the other channel, more bits are allocated to the channel with more information and less bits to the other channel. In total, the bit rate is held at a certain fixed level. This is given by the number of source channels up to a maximum of 5.1-channels. This is called global bit allocation and the most important feature of AC-3. Despite AC-3 being multi-channel, this enables a low bit rate to be achieved, but if the signal conditions are such that processing at the prescribed bit rate is not possible, the high frequency component only is separated into an envelope component and a carrier component and the envelope data is coded with great accuracy. This is based on the psychological nature of sound perceived from the envelope derived from the signal itself. positioned at the high end of the human bearing system.

Figure 2 : Bit allocation complies with number of channels

1-6-3. AC-3 Performance

AC-3 is capable of compressed transmissions up to a maximum of 24 bits but at present most actual transmissions seem to be 16-bit compressed transmissions. No formal specifications have been released yet but the following representative specifications have been extracted from data issued by the Dolby Corporation.

CIRCUIT DESCRIPTION

Frequency characteristics L, C, R, SI, Sr ch	: 20~20 kHz ± 0.5 dB (−3 dB : 3 Hz, 20.3 kHz)
LFE ch	: 20~120 Hz ± 0.5 dB (−3 dB : 3 Hz, 121 Hz)
THD	: 0.1% or less @ 1 kHz
Dynamic range	: 120 dB or more
Separation	: 90 dB or more
Sampling frequency	: 48, 44.1, 32 kHz
Quantification	: 16, 18, 20, 24 bits/sample
Bit rate	: 32 kbps ~ 640 kbps

1-6-4. AC-3 Features

AC-3 has a number of interesting features other than global bit allocation. These are shown below.

(1) Dynamic Range Control

People watching a movie at home late at night may wish to reduce the sound volume when there is an explosion scene, for instance. But they want a level at which they can listen to dialog. To satisfy these conflicting demands, AC-3 is equipped with two functions called dynamic range control and dialog normalization. These are joined by two modes, "Line-out mode" and "RF mode". The first has comparatively little compression and the extent to which it is applied is selectable by the user. The second applies strong compression and has no provision for user selection. Since it changes the gain setting, a gain shift of +11 dB occurs. Since AC-3 holds in its bit stream the information on the dB count of the dialog level when the signal was recorded, this information can also be used to adjust the electronic volume and set the playback level automatically.

(2) Output Configurations

It is stipulated that products which incorporate AC-3 decoders must have the following two configurations.

Figure 3 : Output configuration 1

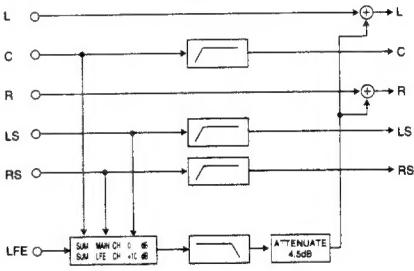

Figure 4 : Output configuration 2

As we can see from Figures 3 and 4, it is not the low frequency effect (LFE) channel alone which is output to the sub-woofer. It is mixed with the low register components of the other channels and output to the sub-woofer. In effect, this LFE channel was conceived originally to supply independent bass sound from 70 mm movie film to a sub-woofer behind the screen. Consequently, base signals appear on the LFE channel only when there are earth-shaking base notes from scenes such as explosions or earthquakes. In effect, it can be considered to be a channel which serves to preserve the bass sounds. This channel is probably called a 0.1 channel because it handles only a band of low frequencies which seldom appear. In configuration 1, all the speakers are small and all contribute base sounds to a sub-woofer. Configuration 2 is a case where the left and right speakers are large, there is not sub-woofer, and the bass notes are handled by the channels with left and right type speakers. Other than these, a configuration 3 has been stipulated as an option in which the speakers other than the center speaker are large. (These output configurations have not been formalized. They are liable to be changed.)

(3) Down-Mixing

Concerning 5.1-channel audio, since not all users will use a 5.1-channel (that is a 6-channel) system for playback, it is extremely convenient to provide for 2-channel stereo or monaural playback. The AC-3 decoder system has a mode which is used when the system is being set up, to enter the number of speakers which the user has. In accordance with this information, the DSP automatically down-mixes the 5.1-channels into the channels which can be played back. Also, since normal tape output is 2-channel, this down-mixing is essential for outputting a 5.1-channel source. However, at the same

CIRCUIT DESCRIPTION

time, it is inconvenient for 5.1-channel playback. For this reason, the use of 2-channel analog input is recommended at such times. Therefore, when connecting the signal lead from the source device to a product which incorporates the AC-3 decoder, it is essential to have analog and digital cables as well as a RF cable which can transmit the AC-3 bit stream. Down-mixing is also required when listening to 5.1-channel sound through headphones but then it is not possible to have surround playback. This inconvenience would disappear if a DSP engine with the power to handle 5.1-channel playback and down-mixing at the same time could be achieved but this would require an extremely fast DSP IC. Figure 5 shows the configuration of a laser disc player. Existing laser discs have the same audio signal recorded on a 2-channel analog FM track and a digital track which has the same format as a 16-bit compact disc. An AC-3 compatible laser disc uses the right channel of the analog FM track to record the AC-3 bit stream signal. Therefore, when the analog track is played back, a buzzing noise is heard from the right channel. But nearly all laser disc players which are being sold now will select the digital track if one is present, do a DA conversion and send out the analog output, so there is no problem with hearing noise.

Figure 5 : Basic configuration of a laser disc player

Figure 6 : Essential block for LD side

Since the AC-3 bit stream is designed to be mounted in the IEC-958 S/PDIF format, it should really be output as a bit stream in the digital output but the demodulator IC to do this is still expensive and, ostensibly to avoid high cost in LD players, it is output as a RF signal from the LD player. The RF output from the LD player will probably disappear when mass production makes this demodulator IC cheaper.

(4) Bit Stream Data

The AC-3 synchronization frame sequence is as shown in the diagram below.

Figure 7 : AC-3 synchronization frame

CIRCUIT DESCRIPTION

Various data other than audio can enter into the BSI. Here we pick up and describe some characteristic features.

- Bit stream mode, the main service, has a three bit code to distinguish between quasi-services and, at the same time, of an emergency.
- Audio coding mode, a 3-bit code, contains code to identify the channel which a particular signal is occupying.
- Bit stream data can carry an 8-bit language code to identify the languages of 128 world countries. By looking at this data, it is possible to know which language is being used for that AC-3 signal. DVD (SD standard) allows up to 8 languages to be entered on a disc at the same time. However, playback is limited to one language at a time. Only one language may be entered at one time on a laser disc.
- 2-bit data giving the size of the mixing room which was used for final mixing.
- It is also possible to enter data to tell whether a bit stream is original or copied from another bit stream (a 1-bit code identifying whether a signal has been Dolby surround encoded).

72-80			Unused

KR-V990D/V9080

CIRCUIT DESCRIPTION

4. Test mode

4-1. Test mode of main unit

(1) Setting the test mode

The main unit is put into the test mode when the AC power is turned ON while pressing the "TUNING DOWN" key. The following state is obtained when the test mode of the main unit is set.

- The power is turned ON automatically.
- All the fluorescent display indicators and LEDs light. (The all-illuminated state is cleared by pressing any main unit key.)
- The backup state except when the power is turned ON and OFF is initialized.

(2) Canceling the test mode

Turn OFF the AC power.

(3) Tuner functions

- Preset channel call function

1) Calls channels 1 to 9 (keys 1 to 9) and channel 10 (key 0) when the +10 key is not operated.

2) Calls channels 11 to 19 (keys 1 to 9) and channel 20 (key 0) when the +10 key is operated once.

3) Calls channels 21 to 29 (keys 1 to 9) and channel 30 (key 0) when the +10 key is operated two times and calls channels 31 to 39 (keys 1 to 9) and channel 40 (key 0) when the +10 key is operated three times.

4) Shifts to the operation obtained when the +10 key is not operated if it is operated four times.

- S level hexadecimal data display function (E, T type)
With the selector on TUNER, when the "AUTO/DOLBY PRO LOGIC" or "DOLBY PRO LOGIC" key on the main unit is operated, the frequency display ceases and the S level is displayed in hexadecimal while the key is pressed.

When "3 STEREO" is operated, the display is switched to restore the normal display.

- MUTE signal output

The tuner MUTE signal is set to OFF at all times and is not controlled at all.

- RDS display mode

Pressing the "DSP LOGIC" key enables the RDS display operation irrespective of the tuned operation.

To return to the normal display, press any key of the main unit.

- Repeater (IR remote control) pin check mode

Pressing the "BAL-L" key enables the POWER ON remote control code of an LD (KENWOOD) to be output from the repeater pin. Message "LD ON" is then displayed on the fluorescent indicator tube.

To return to the normal display, press any key of the main unit.

- E2PROM check mode

Pressing the "BAL-R" key enables data to be written in E2PROM. If the data read from the area in which data

was written is the same as the written data, the operation is proper. If it is different from the written data, message "NG" is displayed on the fluorescent indicator tube.

To return to the normal display, press any key of the main unit.

- Total go-off function

Pressing the "MEMORY" key enables the total go-off operation and normal lighting operation to be performed cyclically.

- Dimmer operation function

Pressing the "VISUAL FIX" key enables the dimmer operation. After that, the cyclic operation that cancels the dimmer operation is performed when the "VISUAL FIX" key is pressed.

- RDS attenuator (E, T type)

With the selector on TUNER, when the "SP A" key on the main unit is operated, the "SP A" display is erased and ATT is on. If the "SP A" on the main unit is operated again after that, "SP A" is displayed and ATT is switched off. The SP A operation and ATT operation work together and are combined with switching the ATT display on and off.

The ATT operation is done from ATT off.

If SP A was turned off with the selector on something other than TUNER, it will come on when TUNER is selected.

(4) AMP function

The original function of each key is executed when the SELECTOR mode is set to TUNER. The test mode operation is not performed in this case.

- One touch max, mid, min setting for Main VOL. input level, Speaker distance and Speaker level. If the selector is on something other than TUNER, max, mid, min settings can be made with the operation rotary encoder and the number keys. (All channel working mode)

(a) Max is number key "3".

(b) Mid is number key "2".

(c) Min is number key "1".

- One touch setting for Main VOL. input level, Speaker distance and Speaker level items. The items of 1) can be specified with respective keys and, if the selector is on something other than the TUNER, direct settings can be made with the number keys. (Initial state is Main VOL.)

(a) Input level is number key "4" + key of 1) : IL

(b) Speaker distance is number key "5" + key of

1) : SD

(c) Speaker level FRONT L is number key "6" + key of

1) : IL

(d) Speaker level FRONT R is number key "7" + key of

1) : FR

(e) Speaker level CENTER is number key "8" + key of

1) : C

(f) Speaker level REAR L is number key "9" + key of 1) : SL

(g) Speaker level REAR R is number key "0" + key of 1) : SR

(h) Speaker level Sub woofer is number key "+10" + key of 1) : SW

• Mute operation

Pressing the "AUTO" key enables the mute operation. After that, the cyclic operation that cancels the mute operation is performed when the "AUTO" key is pressed.

• Midnight operation function

Pressing the "TUNING UP" key enables the midnight operation. After that, the cyclic operation that cancels the midnight operation is performed when the "TUNING UP" key is pressed.

• Dolby surround center mode function

Pressing the "TUNING DOWN" key enables the Dolby surround key to be cyclically changed in the order of normal 'phantom' normal'

• Balance L and R setting in a one-touch motion

Pressing the "BAL-L" key enables the unit to enter the L-channel balance MAX state. After that, the balance center state is returned when the "BAL-L" key is pressed. The cyclic operation is then performed.

Pressing the "BAL-R" key enables the unit to enter the R-channel balance MAX state. After that, the balance center state is returned when the "BAL-R" key is pressed. The cyclic operation is then performed.

• Unconditional AC-3 digital input function (KR-V990D)

This function is used when the AC-3 digital signal based on the DAT source is received. Pressing the "BAND" key enables the unit to enter the unconditional AC-3 digital input state. The "TUNED" lamp on the fluorescent indicator tube then lights. To return to the normal state, press the "BAND" key.

• Sub-woofer SP ON/OFF setting

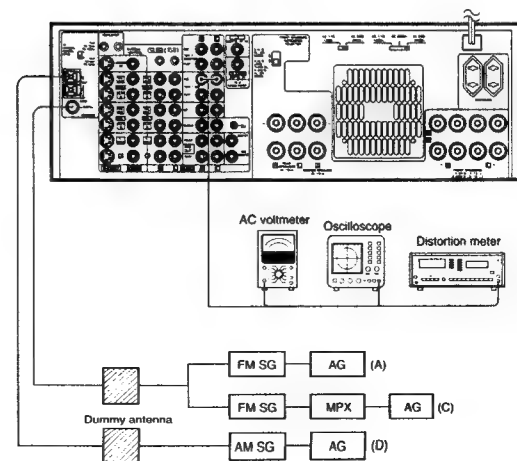

The sub-woofer ON/OFF operation is set by the cyclic operation every time the "MEMORY" key is pressed. The "SPEAKERS" display on the fluorescent indicator tube disappears when the switch is turned off.

• TEST TONE operation

Uses the "DIRECT" key instead of the "TEST TONE" key.

No.	ITEM	INPUT SETTINGS	OUTPUT SETTINGS	TUNER SETTINGS	ALIGNMENT POINTS	ALIGN FOR	FIG.

KENWOOD

CAUTION: For continued safety, replace safety critical components only with manufacturer's recommended parts (refer to parts list). Δ indicates safety critical components. For continued protection against risk of fire, replace only with same type and rating fuse(s). To reduce the risk of electric shock, leakage-current or resistance measurements shall be carried out (exposed parts are acceptably insulated from the supply circuit) before the appliance is returned to the customer.

The DC voltage is an actual reading measured with a high impedance type voltmeter as the AM/FM signal generator is specified to the conditions as shown in the list below. The measurement value may vary depending on the measuring instruments used or on the product. The value shown in () is actual reading measured in the AM mode.

MODE	CARRIER	MODULATION		ANT INPUT
		FREQUENCY	DEVIATION	
FM	98MHz	1kHz	STEREO 67.5kHz 7.5kHz(Pilot)	60dB
AM	1000(999)kHz	400Hz	MONO 30% MOD	60dB

SPECIFICATIONS

For U.S.A. and Canada

Rated power output during STEREO operation

120 watts per channel minimum RMS, both channels driven, at 8 Ω from 20 Hz to 20 kHz with no more than 0.03 % total harmonic distortion. (FTC)

Rated power output during SURROUND operation

Front

105 watts per channel minimum RMS, both channels driven, at 8 Ω , 1kHz with no more than 0.7 % total harmonic distortion.

Center

105 minimum RMS at 8 Ω , 1kHz with no more than 0.7 % total harmonic distortion.

Rear

70 watts per channel minimum RMS, both channels driven, at 8 Ω , 1kHz with no more than 0.7 % total harmonic distortion.

Total harmonic distortion.....0.005%(1 kHz, 60W, 8 Ω)

Frequency response

LINE(CD, AUX, TAPE).....10 Hz ~ 75 kHz, + 0 dB, -3 dB

Signal to noise ratio (IHF'66)

PHONO (MM)75 dB

LINE (CD, AUX, TAPE)98 dB

Input sensitivity / impedance

PHONO (MM)2.5 mV / 47 k Ω

LINE (CD, AUX, TAPE).....200 mV / 47 k Ω

Output level / impedance

TAPE REC200 mV / 2.2 k Ω

PRE OUT (SUBWOOFER)1V / 1 k Ω (KR-V9080)

PRE OUT (FRONT, CENTER, REAR, SUBWOOFER)
.....1V / 1k Ω (KR-V990D)

Tone Control

BASS..... ± 10 dB (at 100 Hz)

TREBLE..... ± 10 dB (at 10 kHz)

LOUDNESS control

VOLUME at -30 dB level+8 dB (at 100 Hz)

DIGITAL AUDIO section (KR-V990D)

Sampling frequency.....32 kHz, 44.1 kHz, 48 kHz

Input level / impedance

Coaxial (TV / CABLE).....0.5 Vp-p / 75 Ω

VIDEO section

TELEVISION format.....NTSC

VIDEO inputs / outputs

VIDEO (composite).....1 Vp-p / 75 Ω

S-VIDEO (luminance signal).....1 Vp-p / 75 Ω

(chrominance signal)0.286 Vp-p / 75 Ω

FM tuner section

Tuning frequency range87.5 MHz ~ 108 MHz

Usable sensitivity (MONO)

.....1.2 μ V (75 Ω) / 13.2 dBf (75 kHz DEV., S/N 30 dB)

50dB quieting sensitivity

STEREO32 μ V (75 Ω) / 41.2 dBf (75 kHz DEV.)

Total harmonic distortion (1 kHz)

MONO0.6 % (65.2 dBf input)

STEREO0.7 % (65.2 dBf input)

Signal to noise ratio (1 kHz, 75 kHz DEV.)

MONO75 dB (65.2 dBf input)

STEREO68 dB (65.2 dBf input)

Selectivity (± 400 kHz).....50 dB

Stereo separation (1 kHz).....40 dB

Frequency response30 Hz ~ 15 kHz, +0.5 dB, -3.0 dB

AM tuner section

Tuning frequency range530 kHz ~ 1,700 kHz

Usable sensitivity (30% mod., S/N 20 dB)

.....16 μ V / (500 μ V / m)

Total harmonic distortion0.7 %

Signal to noise ratio (30 % mod. 1mV input)45 dB

Selectivity30 dB

GENERAL

Power consumption5.2 A

AC outlet

SWITCHED2 (total 150 W, 1.2 A max.)

Dimensions.....W : 440 mm (17 - 5 / 16")

H : 162 mm (6-3 / 8")

D : 396 mm (15 - 9 / 16")

Weight (Net).....12.8 kg (28.2 lb) KR-V9080

13.1 kg (28.9 lb) KR-V990D

Note : KENWOOD follows a policy of continuous advancements in development. For this reason specifications may be changed without notice.

KR-V990D/V9080

Note:

Component and circuitry are subject to modification to insure best operation under differing local conditions. This manual is based on the U.S.A. (K) standard, and provides information on regional circuit modification through use of alternate schematic diagrams, and information on regional component variations through use of parts list.

KENWOOD CORPORATION
